# CURRENT TRENDS IN UROLOGIC ONCOLOGY

February 8 to 10, 2019

THE PINES LODGE | BEAVER CREEK RESORT, CO

## COURSE DIRECTORS

Timothy Wilson, M.D.

## FOCUS

There is a disparity in the state of resident education regarding what the training should be, as opposed to what it really is. This leads to a lack of knowledge on the latest development in treatment for metastatic prostate cancer. Treatment of intermediate and high risk prostate cancer is evolving quickly and practice patterns differ in different regions in the United States. As an example, the use of indocyanine green and color-segmented fluorescence to decrease ureteral strictures is a novel concept to address since this is a complication that has been encountered during radical cystectomy for decades, and is being reported in the literature for the first time.

This gap exists because of multiple factors: lack of information regarding resident expectation, evaluation and current state of resident oversight. Because there are many treatment options for small renal masses, doctors often cannot keep up with the current literature on all treatment strategies and are not accustomed to performing ablative treatments. There is an excessive reliance on oral agents with neglect of chemotherapy in the treatment of prostate cancer, and it exists because chemotherapy has been associated with the perception of severe side effects. Furthermore, gene expression profiles between positive lymph node areas and the primary tumor in prostate cancer has not been evaluated in a surgical context.

## WHO SHOULD ATTEND

This educational program is intended for physicians, urologists, urologic oncologists, surgical oncologists, medical oncologists and all other allied health care professionals interested in the treatment of urologic malignancies.

## OBJECTIVES

- Understand the risks and benefits of ablative treatments as compared to partial nephrectomy and how to create a team approach in treating small renal masses, as well as understand the outcomes of the treatment and in specific situations where they are applied.
- Review the current data of cytoreductive prostatectomy.
- Identify appropriate candidates for systemic chemotherapy for prostate cancer.
- Evaluate ureteral perfusion using a novel technique, and reduce a very common complication seen in bladder cancer surgery.
- Identify regional differences in the delivery of care for intermediate and high risk prostate cancer and recognize data supporting best practices and guideline driven care.
- Incorporate aspects of quality improvement into treatment of intermediate and high risk prostate cancer.
- Discuss gene sequencing tools to analyze lymph node metastases and the primary prostate tumor. Identify how gene sequencing can be integrated into sentinel node evaluation in prostate cancer. Examine how reliable a gene sequencing-based approach to pelvic lymph node metastatic anatomy can be compared to the current surgical standard.
- Increase knowledge of implementing new techniques that will improve resident education regarding robotic surgery.
